SK BOTOX® SERVICES WITH CATHEDRAL DENTAL FACIAL REJUVENATION TREATMENTS – Q&A

1. What Is Botox®?

Botox® is a highly popular method of softening facial expression lines and making the face look refreshed. Every time we frown, squint or smile the skin is creased in the areas of greatest use. The more expressive you are, the deeper the lines become. These expression lines include crows feet, worry lines and frown lines. As we age, collagen production slows down and the problem accelerates as we are less able to repair the damage.

2. Why Should You Come To SK For Your Botox® Treatments?

Your treatments will be performed personally by a fully qualified and experienced Doctor. You will receive a personal consultation to give you as much time as you need to discuss your wishes, and to offer advice, and answer any questions fully. You are the most important person in our clinic!

3. How Does Botox® Work?

The treatment works by relaxing the tiny facial muscles that create expression lines. This means the muscles no longer contract so the overlying skin stays smooth and crease free causing any lines to soften and fade away. The result is a more serene and youthful look.

4. Is It Safe?

Botox® has been used for numerous medical conditions since the 1970's. The cosmetic benefits of Botox® were discovered in 1990 and it has been used effectively and safely worldwide ever since.

5. Are There Any Side Effects?

No serious side effects have ever been reported when using Botox® for cosmetic reasons. Immediately after the injection there may be mild swelling and redness which subsides within a few days. Bruising at the injection site may occur; this can be covered with make-up if needed.

6. Are Your Practitioners Medically Qualified?

Yes. Dr Singh has been qualified to do Botox® treatments since 2005.

7. Are Your Treatments Successful?

Yes. Our clients have provided us with very positive feedback over the years.
